

## IN THE CLAIMS

Please change the whole section as follow:

--What I claim as my inventions are:

1. Form-correcting shoes (including boots, sneakers, slipper and sandals) designed so that when a man wears these shoes and stands straight on a flat ground, his heels are as high as the soles and the body weight does not fall no the toes as he is standing straight on a flat ground on his bare feet with the toe completely lifted up, so that he automatically gets the condition that all skeletal muscles are in equally alert, the backbone is fixed to the pelvis, and the upper arms are fixed to the shoulders.
2. Shoes (including boots, sneakers, slipper and sandals) as claimed in claim 1, characterized by having the heel and sole parts of the shoes sole are at the same height and significantly higher than the toe part, together with having the base surface of the toe part curved up from the ground, so that when a man wears these shoes and stands straight on a flat ground, his heels are as high as the soles and the body weight does not fall no the toes.
3. Shoes (including boots, sneakers, slipper and sandals) as claimed in claim

- 1, characterized by having the heel and sole parts of the shoes sole are at the same height and without the shoe sole under the toes, so that when a man wears these shoes and stands straight on a flat ground, his heels are as high as the soles and the body weight does not fall on the toes.
4. Insole pads used to heighten only/mainly the sole part, not the toe part, of the shoes (including boots, sneakers, slipper and sandals) originally with the heel higher than the sole and toes in order to let the sole and heel parts became at the same height and significantly higher than the toes part, so that when a man wears these shoes with the above insole pads and stands straight on a flat ground, his heels are as high as the soles and the body weight does not fall on the toes.--

Respectfully submitted,
